LED Toggle with Push-Button

Name: An Gyeonheal ID: 21900416

I. Introduction

In this tutorial, we will learn how to use External Interrupt. We will create functions that capture the falling edge trigger by pushing a button using an external interrupt.

The objectives of this lab are to learn how to

- Configure External input (EXTI) interrupt with NVIC
- Create your own functions for configuration of interrupts

Hardware

NUCLEO -F411RE

Software

Keil uVision IDE, CMSIS, EC_HAL

Documentation

STM32 Reference Manual

B. Programming

Procedure

- Create a new folder '**EC/Tutorial/TU_EXTI/**'
- Open the program 'Keil uVision5' and create a new project.
- Name the project as '**TU_EXTI**'.
- Create a new item called 'TU_EXTI.c' and use the given source code Click here to download
- This is an example code for turning LED on/off with the button input trigger.
- Fill in the empty spaces in the code.
- Run the program and check your result.
- Your tutorial report must be submitted to LMS

1. Default state of BOOT0 is 0. It can be set to 1 when a jumper is on pin5-7 of CN7.Two unused jumpers are available on CN11 and CN12 (bottom side of the board).
2. U5V is 5 V power from ST-LINK/V2-1 USB connector and it rises before +5V.
3. PA13 and PA14 share with SWD signals connected to ST-LINK/V2-1, it is not recommend to use them as IO pins if ST-LINK part is not cut.
4. Refer to *Table 10: Solder bridges* for details.
